Java OOPs - Inheritance

Inheritance

- It is the concept of building relationship between two similar classes (parent to child).
- To have common functions
- To avoid duplicate implementations
- To reduce code
- It can be applied to any similar types
 - > class to class
 - > Interface to Interface

Inheritance

Inheritance

Grand Father / Super / Base class

Inheritance

My Father class

Inheritance

Sub Class / Derived Class

Inheritance

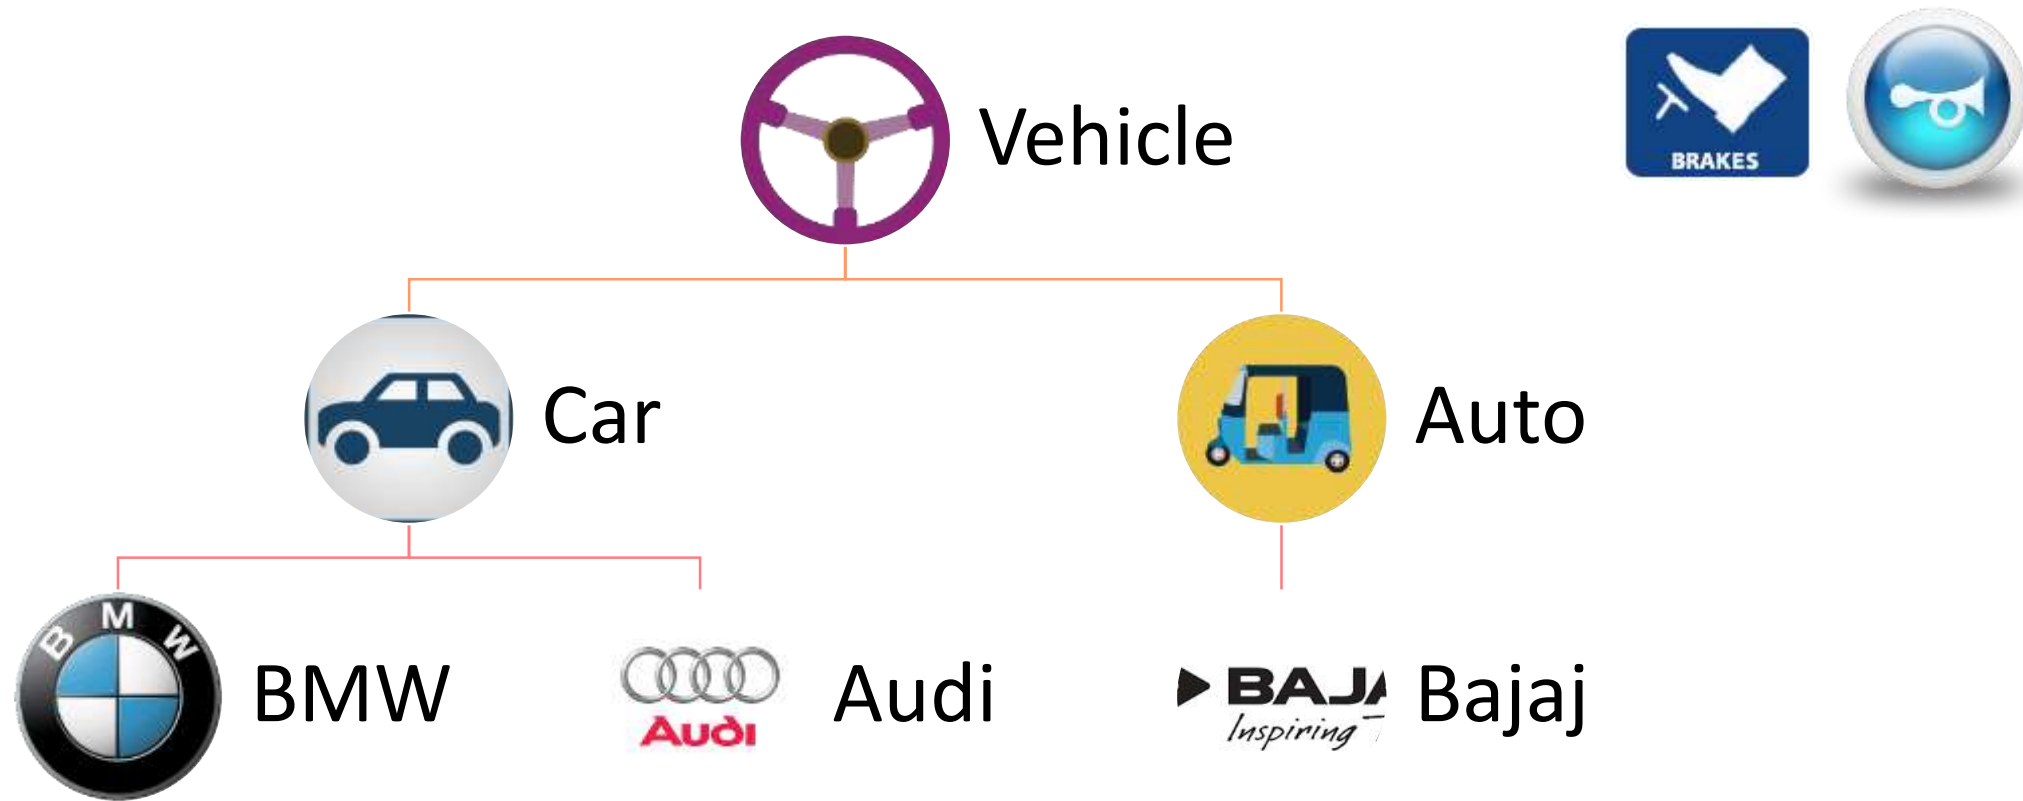

My class

Inheritance

I **extends** My Father **extends** My Grandfather

Inheritance

Inheritance (Another Example)

Inheritance Types

Simple Inheritance

Multi-level Inheritance

Multiple Inheritance

Hierarchical Inheritance

Hybrid Inheritance

Multipath Inheritance

Summary

- Inheritance – **extends** keyword
- Class can extends another class, interface can extends another interface
- Inheritance – **extends** keyword

Classroom (Breakout)

- 1) Create iOS (Super Class)
 - startApp
 - increaseVolume
 - shutdown
- 2) Create iPhone extends iOS
 - makeCall
 - sendSMS
- 3) Create iPad extends iOS
 - watchMovie
- 4) Create a class (MyPhone) with main method
 - Create Object for iPhone
 - Confirm you can access 5 methods !!
 - Confirm you cannot access iPad methods.
